LinkNet 2025 | Network Monetization

Executive summary

Overview

The five supplied CSVs cover 1,000 built homepasses and monthly 2025 customer snapshots. Active CAs grew during the year, but multiple accounts can occupy one home. The decision is how to raise utilization and listed-value monetization before adding network capacity.

333 to 769
active CAs, Jan to Dec

76.9%
December CA density

101.27m
Dec lease proxy, source units

Problem

The five formerly exclusive nodes rank last among 20 nodes by December CA density. F708541 in Jakarta Selatan has 22 CAs across 50 homepasses, compared with 76% density at never-exclusive peers in the same region.

59.6%
former-exclusive cohort, 149 / 250

82.7%
never-exclusive cohort, 620 / 750

Note: First-half snapshots omit 169 former-exclusive homes. The observed difference cannot establish that exclusivity caused the shortfall.

Solution

Run a measured six-month activation pilot on the five nodes. Assign eligible Servcos node-level targets, test multi-Servco access under confirmed contract rights, and make future exclusivity conditional on activation. Defer broad FTTH expansion until actual demand, service quality and node economics are verified.

Same-region peer benchmark

52 CAs | 6.82m monthly lease proxy

Source units; arithmetic scenario, not a forecast or causal estimate.

LinkNet 2025 | Evidence & Action

Executive summary | Supporting insights and priorities

Details & Insights

Infrastructure

75.1% FTTH **vs 81.5%** HFC

December FTTH CA density trailed HFC. FTTH trailed in 14 of 20 mixed-technology nodes; this limits the case for broad expansion but does not establish a technology effect.

Servco and Exclusivity

175 CAs
24.50m source units

XLS led December lease proxy. Former-exclusive nodes moved from 1 active Servco each in June to 5 in December, while snapshot coverage changed. XLS minimum-guarantee field is 0.25; contract terms are unknown.

Media Attachment

46.8% Attach
8.13m margin proxy

Media attached to 360 of 769 December CAs. Catchplay contributed largest product total (2.37m). Jakarta Utara achieved 39.3% attachments (48 of 122 CAs).

Data Quality Note: Money values use source units. Actual invoices, media effective dates, and CATV costs are missing; billed ARPU and full media contribution remain unknown.

Next Steps & Action Priorities

01 **Five-Node Pilot Rollout**
Start the five-node pilot at F708541. Use 13 to 26 additional CAs as a first-stage target and track occupied homes, service quality, and actual lease invoices.

02 **Partner & Contract Verification**
Confirm partner access and XLS guarantee terms. Test multi-Servco access against like-for-like homes before changing exclusivity policy.

03 **Media Offer & Churn Testing**
Test media offers in Jakarta Utara and with TETRA. Measure exposure, attach, billed revenue, full product cost, and churn.
